Amendments to the Claims:

Please amend claim 10 as follows, and please add new claims 20-29 as follows.

This listing of claims replaces all prior versions, and listings, of claims in the application.

Listing of Claims:

1. (original) A device for generating a clock signal and decoding data for use in a contactless integrated circuit device comprising:

a receiver for receiving a radio frequency (RF) signal having a pause period;

a divider for dividing the received RF signal to provide a divided signal;

a first counter for counting a period of the divided signal at each non-pause period of the received RF signal;

a second counter for counting a period of the divided signal; and

a decoder for generating a synchronous clock signal and a decoded data signal in response to outputs of the first and second counters.

- 2. (original) The device according to claim 1, wherein the first counter is reset during the pause period of the RF signal.
- 3. (original) The device according to claim 1, wherein the second counter is reset at a falling edge of the synchronous clock signal.
- 4. (original) The device according to claim 1, wherein the RF signal is based on an ISO-14443 Type A interface.
- 5. (original) The device according to claim 4, wherein the decoder further generates a signal indicating an end of a received frame in response to the outputs of the first and second counters.

Attorney Docket No.:SAM-0438CIP Application Serial No.: 10/672,255 Reply to Office Action of: September 22, 2004

6. (original) A data restoring device for use in a contactless integrated circuit card comprising:

a receiver for receiving an RF signal having a pause period and extracting data and clock signals from the received RF signal;

a divider for dividing the clock signal to generate a divided clock signal;

a first counter for counting a period of the divided clock signal at each non-pause period of the data signal;

a second counter for counting a period of the divided clock signal; and

a decoder for generating a synchronous clock signal and a decoded data signal in response to outputs of the first and second counters.

- 7. (original) The device according to claim 6, wherein the first counter is reset at a start of the pause period of the data signal.
- 8. (original) The device according to claim 7, wherein the first counter is a 3-bit counter.
- 9. (original) The device according to claim 6, wherein the second counter is reset in response to the synchronous clock signal.
- 10. (currently amended) The device according to claim [[9]]6, wherein the second counter is reset at a falling edge of the synchronous clock signal.
- 11. (original) The device according to claim 9, wherein the second counter is a 2-bit counter.
- 12. (original) The device according to claim 10, wherein an output of the second counter sequentially varies between '0' and '2'.

13. (original) The device according to claim 6, wherein the first counter is a 4-bit

counter.

14. (original) The device according to claim 13, wherein the second counter is reset

by a combination of the outputs of the first and second counters.

15. (original) The device according to claim 6, wherein the second counter is a 3-bit

counter.

16. (original) The device according to claim 6, wherein the RF signal is based on an

ISO-14443 A-Type interface.

17. (original) The device according to claim 16, wherein the decoder further generates

a signal indicating an end of a received frame in response to the outputs of the first and second

counters.

18. (original) The device according to claim 6, further comprising an OR gate for

receiving a reset signal for resetting the card and the data signal, wherein the first counter is reset

by an output of the OR gate.

19. (original) The device according to claim 6, wherein the divider includes:

a plurality of division units connected in series between an input terminal and an output

terminal, wherein the input terminal receives the clock signal from the receiver and each division

unit divides an input signal by N (N is an integer); and

a selector for selecting one of outputs of the division units in response to an external

selection signal, as the divided clock signal.

20. (new) The device according to claim 1, wherein the first counter is a 4-bit counter.

Attorney Docket No.:SAM-0438CIP Application Serial No.: 10/672,255 Reply to Office Action of: September 22, 2004

- 21. (new) The device according to claim 1, wherein the second counter is reset by a combination of the outputs of the first and second counters.
- 22. (new) The device according to claim 1, wherein the second counter is a 3-bit counter.
- 23. (new) The device according to claim 1, wherein the second counter is reset in response to a clear signal from the decoder.
- 24. (new) The device according to claim 6, wherein the second counter is reset in response to a clear signal from the decoder.
- 25. (new) A device for generating a clock signal and decoding data for use in a contactless integrated circuit device comprising:
 - a receiver for receiving a radio frequency (RF) signal having a pause period;
 - a divider for dividing the received RF signal to provide a divided signal;
- a 4-bit counter for counting a period of the divided signal at each non-pause period of the received RF signal;
 - a 3-bit counter for counting a period of the divided signal; and
- a decoder for generating a synchronous clock signal and a decoded data signal in response to a combination of outputs of the 4-bit counter and the 3-bit counter.
- 26. (new) The device according to claim 25, wherein the 4-bit counter is reset during the pause period of the RF signal.
- 27. (new) The device according to claim 25, wherein the RF signal is based on an ISO-14443 Type A interface.
 - 28. (new) The device according to claim 25, wherein the 3-bit counter is reset in

Attorney Docket No.:SAM-0438CIP Application Serial No.: 10/672,255 Reply to Office Action of: September 22, 2004

response to a clear signal from the decoder that is generated as the combination of the outputs of the 4-bit counter and the 3-bit counter.

29. (new) The device according to claim 25, wherein the decoder further generates a frame termination signal indicating an end of a received frame in response to a combination of the outputs of the 4-bit counter and the 3-bit counter.
